# BHARAT SIRMAL — PROJECTS

Detailed project, gaming platform, AI assistant and internship project knowledge

## Project 1 — YAOP Community Platform

YAOP is a community-focused platform involving structured event, volunteer, and donation data.

**Work:** Designed and managed a centralized MongoDB database; organized event and volunteer records; processed and validated donation entries; implemented Firebase authentication and structured workflows; built an admin dashboard for data entry and record updates.

**Result:** The admin dashboard reduced manual effort by approximately 40% and helped minimize input errors.
**Technologies:** Next.js, Express.js, MongoDB, Firebase, Cloudinary

## Project 2 — FrameForge Gaming Platform

FrameForge is a gaming-focused platform involving users, gaming products, orders, authentication, APIs, and database operations.

**Database:** Designed and maintained MongoDB schemas for users, products, and orders.
**Backend:** Engineered RESTful CRUD APIs for create, read, update, and delete operations.
**Security:** Implemented role-based data access separating admin and user records.
**Testing:** Used Postman for data validation, API testing, and performance checks.
**Team:** Collaborated in a 4-member team using Git for version control and task coordination.
**Technologies:** React.js, Express.js, MongoDB, Firebase, REST APIs, Postman, Git

## Gaming Website Content & Features

The gaming website is designed around a modern gaming experience with a product catalog and structured user/order system.

- Home and hero section with gaming-focused visual presentation
- Gaming product catalog and product cards
- Product detail pages
- Category browsing and search/filter functionality
- User registration and authentication
- Cart and order workflow
- User account/dashboard functionality
- Admin management for products, users, and orders
- MongoDB-backed product, user, and order records
- REST APIs for CRUD operations
- Role-based access control
- Postman-based API testing and validation

## Project 3 — Bharat AI Personal Assistant

Bharat AI is a personal AI assistant designed for Bharat's portfolio. It uses Retrieval-Augmented Generation (RAG) so that answers about Bharat are grounded in his personal knowledge base.

**Architecture:** Portfolio frontend → FastAPI backend → vector retrieval → ChromaDB/vector embeddings → Gemini API → response.
**Knowledge:** Personal profile, education, skills, projects, internship, achievements and career information.
**Interface:** Text input and voice interaction can be supported while keeping the RAG backend as the central knowledge and response layer.

## Project 4 — Web Development Internship Work

During the Web Development Internship at InAmigos Foundation from May 2026 to June 2026, Bharat assisted with developing and maintaining the organization's website, implemented new features, and improved its layout, structure, functionality, and visual presentation.
**Technologies:** HTML, CSS, JavaScript, React, Node.js, MongoDB
